Contents

Acknowledgements	1
1 Introduction	3
1.1 Cellular Automata	3
1.2 Boolean networks	6
2 A Class of Decision Problems for One-dimensional Cellular Automata	9
2.1 Definitions and notations	10
2.2 Decision Problems: CAs converging only to the required fixed points	12
2.2.1 Equivalence class of f	18
2.2.2 Shift equivalence	20
2.2.3 Equivalence of composite functions	26
2.3 Applications	27
2.3.1 CAs with radius $r = \frac{1}{2}$	27
2.3.2 CAs with radius $r = 1$	27
2.3.3 CAs with radius $r = 1.5$	28
2.3.4 CAs with radius $r = 2$	34
3 Computational complexity of the stability problem in the elementary cellular automata rule space	35
3.1 Definitions and notations	37
3.2 Characterisation of the $0 \rightarrow 1$ stability problem	40
3.2.1 Complexity of the rules in $A \cup B \cup C \cup D \cup E$	40

3.2.2	Complexity of the rules in set F	45
3.2.3	Complexity of the rules in set G	53
3.3	Characterisation of the $1 \rightarrow 0$ stability problem	65
3.3.1	Complexity for the rules in $A \cup B \cup C$	66
3.3.2	Complexity for the rules in set D	66
3.3.3	Complexity of the rules in set E	67
3.3.4	Complexity for the rules in set F	68
3.3.5	Complexity for the rules in set G	71
3.3.6	Complexity of the rules in set H	72
3.3.7	Complexity of the rules in set I	72
3.3.8	Complexity of the rules in set J	73
4	The attractor landscapes in Boolean networks with firing memory	77
4.1	The models	78
4.1.1	Definitions and notations	78
4.1.2	Equivalence(s) between BNs, GPBNs, MBNs	80
4.1.3	Some particular classes of MBNs	84
4.2	MBN with two genes	87
4.2.1	Networks admitting one fixed point	87
4.2.2	Networks admitting two fixed points	100
4.2.3	Networks admitting three fixed points	110
4.3	Application to specific genetic regulation networks	113
4.3.1	Immunity control in bacteriophage λ	113
4.3.2	Floral morphogenesis of <i>Arabidopsis thaliana</i>	115
5	Conclusions and perspectives	121

Acknowledgements

I thank my parents and sister for their unconditional support they gave me in these years when I was in the program.

To my advisors, Eric Goles and Pedro Balbi for the help, the confidence placed and for their enthusiasm in the research.

I thank my mates and faculty staff of the DISC and all of the members of the Natural Computing Laboratory of the Universidade Presbiteriana Mackenzie in Brazil for their great welcome, especially to Eurico Ruivo who, in addition to working with me, was a great help in my stay in Brazil. I also thank to Ana Carolina, Dávila and Yopanan since for their hospitality they made me feel at home the times I was there.

I especially thank Marco Montalva and Edgardo Olate for all the support provided and the company during these years in the doctorate, and also to all those people who directly and indirectly encouraged and helped me in this process.

To the UAI for the PhD scholarship that helped me to finance a large part of my studies.

This thesis is the first outcome of the joint PhD degree established between DISC-UAI and the Brazilian programme PPGEEC – Programa de Pós-Graduação em Engenharia Elétrica e Computação – from Universidade Presbiteriana Mackenzie, São Paulo, SP, Brasil, and was funded by the support provided to my co-supervisor by the Brazilian agencies CAPES – Coordenação de Aperfeiçoamento de Pessoal de Nível Superior – by means of the projects STIC-AmSud (CoDANet) no. 88881.197456/2018-01 and Mackenzie-PrInt no. 88887.310281/2018-00, and CNPq-PQ 305199/2019-6, and the support provided to my supervisor by the ECOS C16E01 Project and the FONDECYT 1070022 Project.
